

Purple: trait 1 below −1 SD. The same 600 parents are shown; all 20,000 determine the percentages and means.

D Where does the parental mean end up?

Distance from starting mean

Curved surface **0.64**

Linear plane **0.83**

Distance uses both traits in SD units.

What the plane gets wrong

The plane explains 90.2% of variation in log expected output.

It gives too much weight to parents with low trait 1 values.

It overestimates the distance the mean shifts by 30%.

Map colour: log expected output relative to the starting mean

Darker = more expected offspring.
